Consider the Impact of VTEs*

VTEs can lead to substantial harm to patients and staggering financial expense.

More than 2 million Americans develop a VTE each year.¹

More than 200,000 patients die each year from a VTE, representing more deaths than those from breast cancer, AIDs, and traffic accidents combined.¹

The cost for VTE treatments ranges from $7,712–$16,644 per patient in the hospital.²

VTEs are estimated to cost the U.S. healthcare system at least $7–$12 billion dollars annually.³

VTE is the 5th most frequent reason for unplanned hospital readmissions after surgery, overall, and the 3rd most frequent among patients undergoing total hip or knee joint replacement.⁴
